All these options are not accessible when you use Photoshop Elements. This is one of the reasons why some people prefer Photoshop Elements over full Photoshop. 1. Field of the Invention The present invention relates to a rear projection type display apparatus, and more particularly to a rear projection type display apparatus in which cooling efficiency of a cooling device, such as a defroster and the like, is improved. 2. Description of the Related Art Generally, a rear projection type display apparatus is a type of display apparatus that allows an image, which is projected on the rear side of a screen by a projector, to be viewed by viewers located on the front side of the screen, and occupies a relatively wide display area on the screen. The rear projection type display apparatus requires a cooling device, such as a defroster and the like, because external heat is generated when the display apparatus is operated. The defroster is, in particular, an essential component which controls the temperature of the screen or surroundings of the screen through cooling, and regulates the heat generated from an optical component, such as a light source and the like, disposed in a forward portion of the screen or the like to a desired temperature. Therefore, various types of defrosters have

been developed and used for the rear projection type display apparatus. Referring to FIGS. 1 and 2, a conventional defroster is described. FIG. 1 is a schematic view of a rear projection type display apparatus according to a conventional defroster, and FIG. 2 is an enlarged view of a region C in FIG. 1. As shown in FIGS. 1 and 2, a conventional defroster 2 includes a cooling device unit 3, an air suction unit 4 and a discharge unit 5. The cooling device unit 3 is disposed in a forward portion of a rear projection type display apparatus 1. The air suction unit 4 and the discharge unit 5 are disposed on the upper and lower surfaces of the rear projection type display apparatus 1, respectively. The cooling device unit 3 includes a cooling case 6 having therein an evaporator 7, an air outlet 8 and an air inlet 9. The evaporator 7 is, for example, a heat pipe which requires a constant temperature, and functions to cool the rear projection type display apparatus 1, and to heat and exchange heat with external air. The evaporator 7 is formed in a cylindrical shape, and is disposed at one side of the air inlet 9 in the cooling case 6. The air inlet 9 is disposed at one side of the air outlet 8. The air outlet 8 discharges heat, and supplied from an
